Below this article you can see basic suffixes used in this template (at positions bottom1-bottom4). Please remember about using space at beginning of suffix name in module options.

Suffix **clear** is used usually in header positions for Image Show and GK Tab modules.

Please remember that if you have a module News Show Pro then you have to set suffix **nsp** for that module - this suffix adds relative positioning to main module container which is necessary for correct module interface positioning.

Additional suffixes available for News Show Pro GK1 module:

- **nsp_nm** - useful when you have disable module title and you want to set article title in place of module title
- **nsp_st** - small titles in the module
- **nsp_st** - big titles in the module

For GK Tab module you can use color suffixes: **red**, **green**, **blue**, **neutral**.
